Precision Power Analysis from Voltech

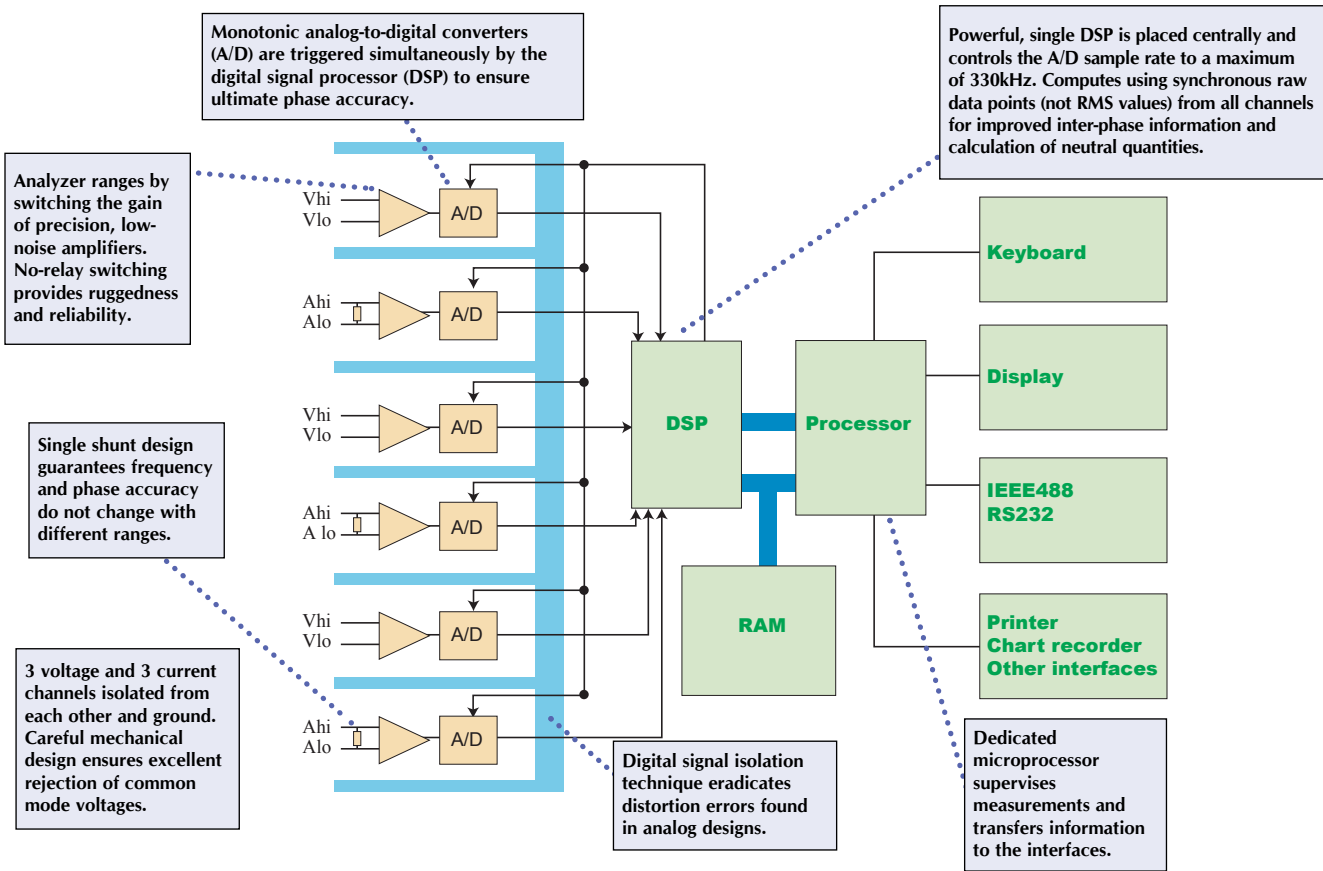

Voltech launched the world's first commercially available digital power analyzer, the PM1000, in 1987 and the world's first digital three-phase power analyzer, the PM3000, in 1989. In 1993, the PM3000A power

analyzer was the first to use DSP (Digital Signal Processor) technology. Today, the PM3000ACE offers power measurement professionals an unrivalled combination of versatility and accuracy.

- Single and three-phase models.
- Intuitive front-panel or Windows software operation.
- High 0.05% basic accuracy.
- Wide bandwidth measurements, DC and 0.1Hz to 1MHz.
- Measures W, V, A, VA, Var, power factor, Cos, Vpk, Apk, crest factors, frequency and inrush current.
- Harmonics of V, A (incl. phase) and W to the 99th. THD.
- Integrator for W-hr, VA-hr, A-hr, VA-hr, average and target PF.
- Crest factors up to 20.
- Accurate on distorted waveforms and at low power factors.
- VPAS PC software for set-up, data storage and handling.
- IEC61000-3 Windows software for full or pre-compliance testing.
- All interfaces fitted as standard. (See back page for model options).
- All instruments supplied with test leads, user manual and certificate of calibration and conformance traceable to international standards.
- Range of accessories includes current clamps and transformers, PS1000 switch for inrush measurements and Ballast CT for electronic ballast testing.

Measurements

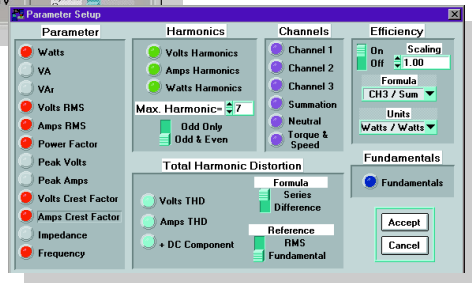

The versatile PM3000ACE can be quickly configured to make reliable, accurate measurements in even the most demanding power electronics applications. Illustrated here by the VPAS software, all features except IEC61000-3 are also available with a few simple keystrokes on the front panel.

- Unique PWM motor drive mode locks onto wide range of fundamental frequencies from 0.1Hz to 1kHz. Total W, V, A, etc. measurements are made to the full 1MHz bandwidth. No data is lost.
- Ballast mode quickly sets up the analyzer for measurements on the waveforms found in electronic ballasts and ultrasonics.

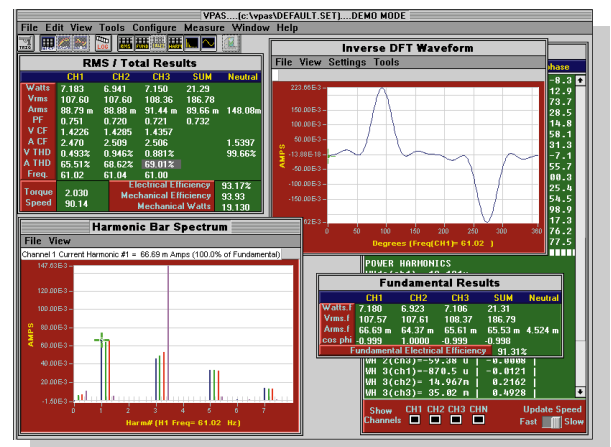

- Power transformer test mode displays corrected power and k factors to IEC76 and IEEE57.
- Scale factors for current and voltage transformers/transducers and torque/speed inputs are quickly entered and stored.
- Over 200 further functions and features quickly accessible.

- Results available for all three phases plus SUM and neutral.
- Harmonics of Volts and Amps, including accurate harmonic phase for computation of Watts harmonics and inverse DFT waveform (VPAS).

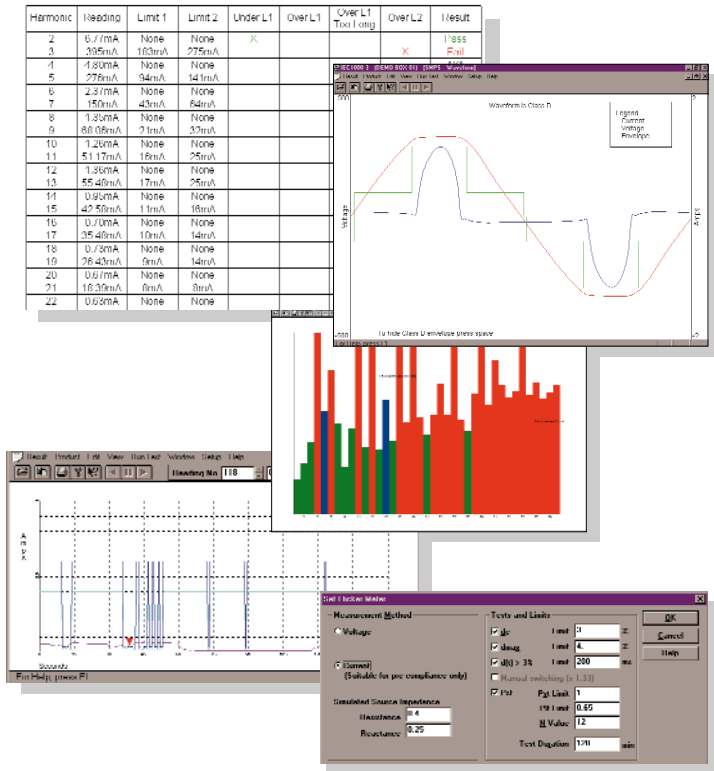

- Waveform datalog and harmonic barcharts shown in software.
- Cycle-by-cycle capture of RMS data for start-up and other transient conditions.
- Timed datalog of results.

Harmonics and Flicker

- Full compliance testing to IEC with -002 model, impedance network and AC source.
- Pre-compliance stand-alone with any model.
- Traceable, certified accuracy.
- Current and voltage harmonics, power and power factor measured throughout a test.
- Windows software with diagnostic features.
- Fluctuating harmonics
 - Waveform display and Class D checking.
 - Current and voltage harmonics, power and power factor measured throughout a test.
 - Fluctuating limits calculated for each 16-cycle block.
 - Playback of individual harmonic over time showing power and fluctuating limits.
 - Normalised, worst-case bar-graph shows margin of safety.
- Flicker
 - Short-term (Pst) and long-term (Plt) flicker, d(c), d(max) and d(t).
 - Instantaneous flicker sensation (IFS) displayed continuously during test.

Specification

Specifications can often be confusing and time consuming to interpret for use in real-life applications. The effects due to frequency, power factor and instrument range must all be considered when calculating total errors.

The graphs below show the total maximum errors of the PM3000A at 115Vrms and 5Arms as a percentage of the reading.

NB: All specifications are valid for one year from calibration and at $23^{\circ}\text{C} \pm 5^{\circ}\text{C}$.

Maximum Voltage and Current Error Vs Frequency

— 115V rms

— 5A rms

Volts 45 to 450Hz
 $\pm 0.05\% \text{ rdg} \pm 0.05\% \text{ rng}$

Amps 45 to 450Hz
 $\pm 0.05\% \text{ rdg} \pm 0.05\% \text{ rng}$
 $\pm 100\mu\text{A}$

Maximum Power Error Vs Frequency

Watts 45 to 450Hz, PF = 1

$\pm A \text{ rdg} \times V \text{ error}$
 $\pm V \text{ rdg} \times A \text{ error}$
 $\pm 0.04\% \text{ rdg}$

Maximum Power Error Vs Power Factor

Watts 45 to 450Hz

$\pm A \text{ rdg} \times V \text{ error} \times \text{PF}$
 $\pm V \text{ rdg} \times A \text{ error} \times \text{PF}$
 $\pm (0.04/\text{PF})\% \text{ rdg}$
